1.

What does a neuron compute?

○ A neuron computes the mean of all features before applying the output to an activation function

○ A neuron computes a function g that scales the input x linearly (Wx + b)

○ A neuron computes an activation function followed by a linear function (z = Wx + b)

▲

This should not be selected
No. It is the other way round. A neuron computes a linearity (Wx + b) and then an activation g (sigmoid, tanh, ReLU, ...).

○ A neuron computes a linear function (z = Wx + b) followed by an activation function

---

✔ 1 / 1
points

2.

Which of these is the "Logistic Loss"?

○

○

○)

▲

Correct
Correct, this is the logistic loss you've seen in lecture!

○

✓   **1 / 1**
       points

Neural Network Basics   **9/10 points (90%)**

3.

Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?

○   x = img.reshape((32*32,3))

⦿   x = img.reshape((32*32*3,1))
▲

Correct

○   x = img.reshape((3,32*32))

○   x = img.reshape((1,32*32,*3))

✓   **1 / 1**
       points

4.

Consider the two following random arrays "a" and "b":

```
1   a = np.random.randn(2, 3) # a.shape = (2, 3)
2   b = np.random.randn(2, 1) # b.shape = (2, 1)
3   c = a + b
```

What will be the shape of "c"?

⦿   c.shape = (2, 3)
▲

Correct
Yes! This is broadcasting. b (column vector) is copied 3 times so that it can be summed to each column of a.

○   The computation cannot happen because the sizes don't match. It's going to be "Error"!

○   c.shape = (3, 2)

○   c.shape = (2, 1)

✓   **1 / 1**
       points

Quiz, 10 questions

5.
Consider the two following random arrays "a" and "b":

```
1  a = np.random.randn(4, 3) # a.shape = (4, 3)
2  b = np.random.randn(3, 2) # b.shape = (3, 2)
3  c = a*b
```

What will be the shape of "c"?

○ c.shape = (4,2)

◉ The computation cannot happen because the sizes don't match. It's going to be "Error"!

Correct
Indeed! In numpy the "*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).

○ c.shape = (3, 3)

○ c.shape = (4, 3)

✔ 1 / 1 points

6.
Suppose you have n_x input features per example. Recall that $X = [x^{(1)} x^{(2)} ... x^{(m)}]$. What is the dimension of X?

○ $(m,1)$

○ $(1,m)$

○ (m,n_x)

◉ (n_x, m)

Correct

✔ 1 / 1 points

7.

Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a*b" performs an element-wise multiplication.

9/10 points (90%)

Quiz, 10 questions

Consider the two following random arrays "a" and "b":

```
1  a = np.random.randn(12288, 150) # a.shape = (12288, 150)
2  b = np.random.randn(150, 45) # b.shape = (150, 45)
3  c = np.dot(a,b)
```

What is the shape of c?

○ c.shape = (12288, 45)

▲

Correct

Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because :

"number of columns of a = 150 = number of rows of b"

○ c.shape = (12288, 150)

○ c.shape = (150,150)

○ The computation cannot happen because the sizes don't match. It's going to be "Error"!

✔   1 / 1
      points

8.

Consider the following code snippet:

```
1  # a.shape = (3,4)
2  # b.shape = (4,1)
3
4  for i in range(3):
5    for j in range(4):
6      c[i][j] = a[i][j] + b[j]
```

How do you vectorize this?

○ c = a + b.T

▲

Correct

○ c = a.T + b

○ c = a.T + b.T

○ c = a + b

---

9/10 points (90%)

9.

Consider the following code:

```
1  a = np.random.randn(3, 3)
2  b = np.random.randn(3, 1)
3  c = a*b
```

What will be c? (If you're not sure, feel free to run this in python to find out).

○ This will invoke broadcasting, so b is copied three times to become (3,3), and $*$ is an element-wise product so c.shape will be (3, 3)
Correct

○ This will invoke broadcasting, so b is copied three times to become (3, 3), and $*$ invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)

○ This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).

○ It will lead to an error since you cannot use "*" to operate on these two matrices. You need to instead use np.dot(a,b)

---

points

10.

Consider the following computation graph.

What is the output J?

○ J = (c - 1)*(b + a)

○ J = (a - 1) * (b + c)
